## EcoSec.eu: Extensive application database for for semi-micro GPC applications from Tosoh Bioscience

The new EcoSec website presents itself in a completely new design with detailed information about hardware, software and an extensive application database.

The starting page displays a 3D-Animation of the EcoSEC instrument, which can– by clicking on the individual components – be zoomed in to be view them in more detail. The highlights of the component are automatically displayed here.

The heart of the website is the extensive application database. The user can find information among a database of more than 300 application examples. The applications are structured in three main categories – polymer class, individual polymers or the respective TSK-GEL column type, but can also be searched in a direct keyword search.

Among information about the EcoSEC hardware, software and the specifically well suited TSK-GEL semi-micro columns, the website has a direct contact page, where interested users can subscribe to the Tosoh Bioscience newsletter. The newsletter provides up-to-date information about the EcoSEC instrument and news from Tosoh Bioscience.

EcoSEC is a compact, all-in-one GPC system designed for semi-micro GPC applications. It offers outstanding performance and short analysis time when combined with special semi-micro GPC columns. Key features of the system are the low system dead volume, outstanding pump reproducibility and an extremely stable baseline of the dual flow refractive index detector. Semi-micro GPC saves solvent, sample amount, analysis time and waste disposal costs.
